

1.25.2.1 Hotfix Release Items: February 2021

What has changed...	What it means...
ESTR-IRB, Person	
Daily update processing will include additional handling on profile creation	Background operations are updated to include a custom step, ensuring the profile is set up completely. This addresses a legacy issue with vendor-provided application-native person set up attributes which have no impact on system use.
OAIR, Triage Rules	
Enhanced rules to ensure two additional submission attributes are captured in review.	Two additional scenarios will be captured for administrative review: • All research certifications where there are associated disclosures (new and previously reviewed) • When a person indicates that there is information to disclose, but no disclosures are listed
Error checking updated to validate appropriate information	Error checking was previously over-inclusive, attempting to check for required responses to questions associated with disclosures staged for deletion (“inactive disclosures”). Error checking has been fixed to no longer block validation, submit disclosures, or submit clarifications with these errors for items staged for deletion.
